

## Project Development Phase

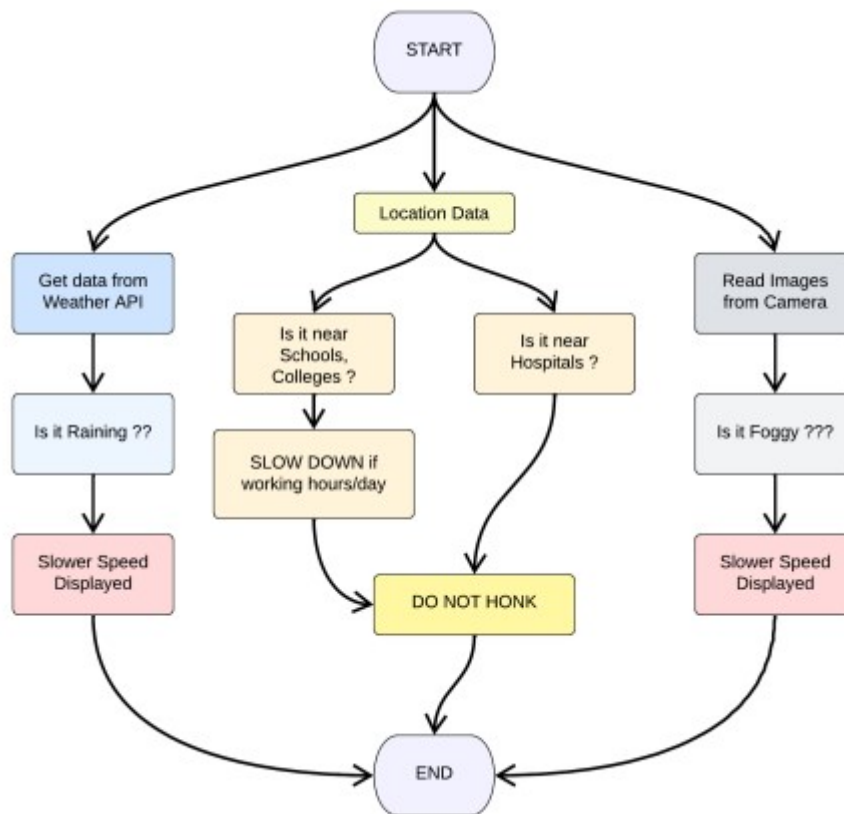

<b>Date</b>	27 October 2022
<b>Team ID</b>	PNT2022TMID41909
<b>Project Name</b>	Signs with Smart Connectivity for Better Road Safety

### Project Development - Delivery of Sprint – 2

#### Sprint Goals :

1. Create and initialize accounts in various public APIs like OpenWeather API.
2. Write a Python program that outputs results given the inputs like weather and location.

#### Code Flow :

## Python code:

### Weather.py

This file is a utility function that fetches the weather from OpenWeatherAPI. It returns only certain required parameters of the API response.

# Python code

```
import requests as reqs
```

```
def get(myLocation,APIKEY):
```

```
    apiURL =
```

```
    f"https://api.openweathermap.org/data/2.5/weather?q={myLocation}&appid={APIKEY}"
```

```
    responseJSON = (reqs.get(apiURL)).json()
```

```
    returnObject = {
```

```
        "temperature" : responseJSON['main']['temp'] - 273.15,
```

```
        "weather" : [responseJSON['weather'][_]['main'].lower() for _ in  
range(len(responseJSON['weather']))],  
        "visibility" : responseJSON['visibility']/100, # visibility in percentage where 10km is 100%  
and 0km is 0%
```

```
    }
```

```
    if("rain" in responseJSON):
```

```
        returnObject["rain"] = [responseJSON["rain"][key] for key in responseJSON["rain"]]
```

```
    return(returnObject)
```

## brain.py

This file is a utility function that returns only essential information to be displayed at the hardware side and abstracts all the unnecessary details. This is where the code flow logic is implemented.

# Python code

# IMPORT SECTION STARTS

```
import weather
from datetime import datetime as dt
```

# IMPORT SECTION ENDS

# -----

# UTILITY LOGIC SECTION STARTS

```
def processConditions(myLocation,APIKEY,localityInfo):
```

```
    weatherData = weather.get(myLocation,APIKEY)
```

```
    finalSpeed = localityInfo["usualSpeedLimit"] if "rain" not in weatherData else
localityInfo["usualSpeedLimit"]/2
```

```
    finalSpeed = finalSpeed if weatherData["visibility"]>35 else finalSpeed/2
```

```
    if(localityInfo["hospitalsNearby"]):
```

```
        # hospital zone
```

```
        doNotHonk = True
```

```
    else:
```

```
        if(localityInfo["schools"]["schoolZone"]==False):
```

```
            # neither school nor hospital zone
```

```
            doNotHonk = False
```

```
        else:
```

```
            # school zone
```

```
            now = [dt.now().hour,dt.now().minute]
```

```
            activeTime = [list(map(int,_.split(":"))) for _ in localityInfo["schools"]["activeTime"]]
```

```
            doNotHonk = activeTime[0][0]<=now[0]<=activeTime[1][0] and
```

```
activeTime[0][1]<=now[1]<=activeTime[1][1]
```

```
    return({
```

```
        "speed" : finalSpeed,
```

```
        "doNotHonk" : doNotHonk
```

```
    })
```

# UTILITY LOGIC SECTION ENDS

## main.py

The code that runs in a forever loop in the micro-controller. This calls all the util functions from other python files and based on the return value transduces changes in the output hardware display.
